InFlex™ Flexible Facing System

Newly-designed Crystaplex® 6A boards modified to employ a central section of polyurethane foam that allows the board facing to flex and disperse a portion of the impact when struck by a player but remain stiff when a puck makes contact.

This integration of new materials and technology reduces peak impact to make the game safer for players, while not impacting the pace of play.

Key features:

- 1 Reduce peak player impact
- 2 Up to 65% improved energy absorption
- 3 150-450% increase in deflection versus traditional steel
- 4 Doesn't impede puck play
- 5 Crystaplex® 6A system option
